Text as Cell-like Structure

Abstract

Human communication takes place mainly verbally, by means of words. Words are like cells, with a phonetic or graphical membrane that wraps the content, that is the semantic molecules, the semantic features. The words are connected in the form of propositions to express different ideas. The propositions, for their part, are connected to express a set of coherent ideas, a text. In principle, a text has always a theme, a main idea. The theme is often concentrated on a word that functions as a nucleus, a cell that contains the necessary basic informations to develop and shape a composition.
